Project Proposal:Online Library System

Our project is an Online Library System that helps students and other users find books and manage their library activities online. In a traditional library, users usually need to visit the library to search for books and ask about their availability. Our system aims to make this process easier by allowing users to access the library through a website.

Intended Use of the System:

The system will be used by three main types of users: students or library members, librarians, and administrators.

Students and Library Members: Users will be able to create an account, log in, search for books by title or author, and view information about each book. They can also check whether a book is available and send a request to borrow it. Users will be able to view their current borrowed books and check their borrowing history.

Librarians: Librarians will manage the books available in the library. They can add new books, update book information, remove books when necessary, and manage borrowing and returning requests. This will help them keep the library organized and reduce the amount of manual work.

Administrators: Administrators will be responsible for managing user accounts and controlling access to the system. They can monitor the system and make sure that its main functions are working properly.

Overall Functionality

The Online Library System will provide several features to help users complete their tasks easily.

First, the system will have a registration and login feature to allow users to access their accounts. Each user will have access to the functions related to their role.

Second, the system will provide a book search feature. Users can search for books using different details, such as the book title, author, or category. The results will show basic information about each book and its availability.

Third, the system will manage borrowing and returning operations. Users can submit borrowing requests, and the librarian can approve or reject them. When a book is borrowed or returned, its availability will be updated in the system.

The system will also keep records of borrowed books and their return dates. This will help users follow their borrowing activities and help librarians manage the library more efficiently.

Finally, the system will provide a simple and user-friendly interface so that users can navigate between its pages without difficulty.

Expected Benefits

The Online Library System is expected to save time for both users and librarians. Users will be able to find books more quickly without searching through shelves manually. Librarians will have an organized way to manage books, users, and borrowing records. The system will also reduce errors that may happen when information is recorded on paper.

In conclusion, this project aims to make library services easier to access and manage. It will provide a practical solution for organizing library operations and improving the experience of students and other library members.
